History of Reinforced Concrete and Structural Design. Posted on October 11, 2011 by engineer's outlook. The average person thinks that concrete has been in common use for many centuries, but such is not the case. Although the Romans made cement - called Pozzolana - before Christ by mixing slaked lime with a volcanic ash from Mount Vesuvius and used it to make concrete for building, the art ...

Structural engineering is a sub-discipline of civil engineering in which structural engineers are trained to design the 'bones and muscles' that create the form and shape of man-made structures. Structural engineers need to understand and calculate the stability, strength and rigidity and earthquake of built structures for buildings and nonbuilding structures.

This design concept is based on elastic theory, assuming a straight line stress distribution along the depth of the concrete. The actual loads or working loads acting on the structure are estimated and members are proportioned on the basis of certain allowable stresses in concrete and steel. The allowable stresses are fractions of the crushing strength of concrete (f_c) and the yield strength ...
